

CLAIMS

1. A compressor comprising

a reed valve (41) which opens and closes a discharge port (29) of a compressor
5 mechanism (20) and includes a flat part (41a) and a protruding part (41b) formed at a distal
end of the flat part (41a) to come in and out of the discharge port (29), wherein

the shape of the discharge port (29) and the shape of the reed valve (41) are
determined to satisfy

$$S2 \geq S1 \geq S0$$

10 wherein S0 is an opening area of an inlet (29a) of the discharge port (29),

S1 is the smallest sectional area of a flow passage formed between the protruding
part (41b) and the discharge port (29) when the reed valve (41) is lifted to the maximum
level and

S2 is the smallest sectional area of a flow passage formed between the flat part
15 (41a) and the outer periphery of an outlet (29b) of the discharge port (29) when the reed
valve (41) is lifted to the maximum level.

2. The compressor of claim 1, wherein

the discharge port (29) is tapered from the outlet (29b) to the inlet (29a).

20 3. The compressor of claim 1 or 2, wherein

a seat (22b) is formed at the outer periphery of the outlet (29b) of the discharge
port (29) such that the seat (22b) contacts the flat part (41a).
